Summary

- Optical layer disaggregation
 - Uncertainty on optical margins
 - Recent work on embedding ML into control plane algorithms
- Control plane design: simulation or experimentation?
 - Open testbeds: COSMOS, OpenIreland
 - Open emulation tools: Mininet-Optical
- Merging simulation with experimentation
 - Use case1: Metro front-haul provisioning
 - Use case2: Building a QoT estimation algorithm

Optical layer disaggregation

- The open networking movement has permeated across all aspects of networking: OpenRAN, cloud Central Office (SEBA), disaggregated optical networks.
- This show the optical layer disaggregation process:

- What it means:
 - Mix and match transponders, amplifiers, ROADMs, control loops, optical control plane

Studying the margins

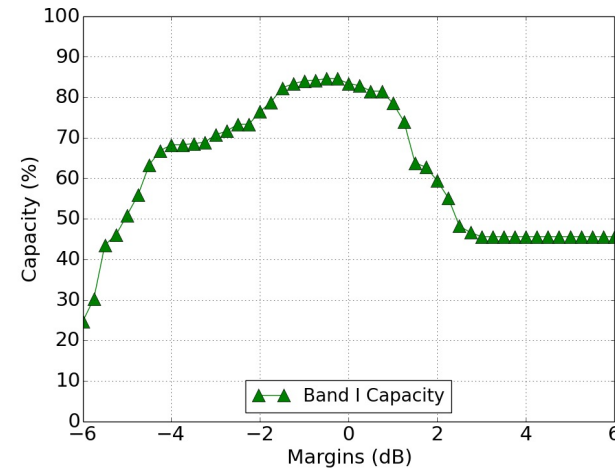

Network topology

Statistically distributed EDFA gain models

Estimation assumes flat amplifier gain

More conservative

More aggressive

$$\text{OSNR}_{\text{est}} + \text{Margin} > \text{OSNR}_{\text{th}}$$

X axis: how conservative are the margins

Use of Machine Learning algorithms for QoT estimation, etc.

QoT prediction using random forest ML algorithm

Dependency on training set size

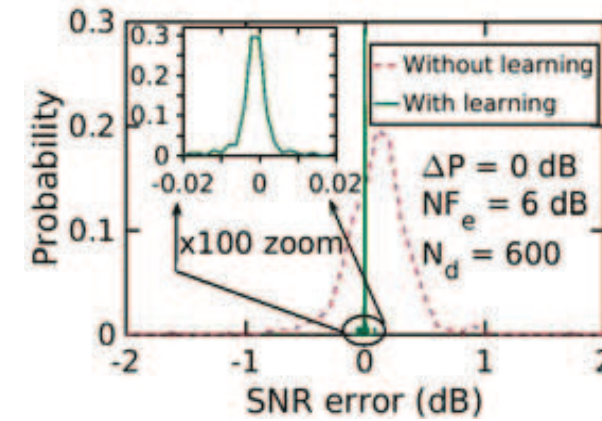

Relevance of different features

Control plane design, experimentation or simulation?

Network infrastructure experimentation good for:

- Data collection (especially training of ML algorithms)
- Compatibility test with hardware interfaces
- Understand constraints (features, timing) from hardware devices
- Ultimate test on operability

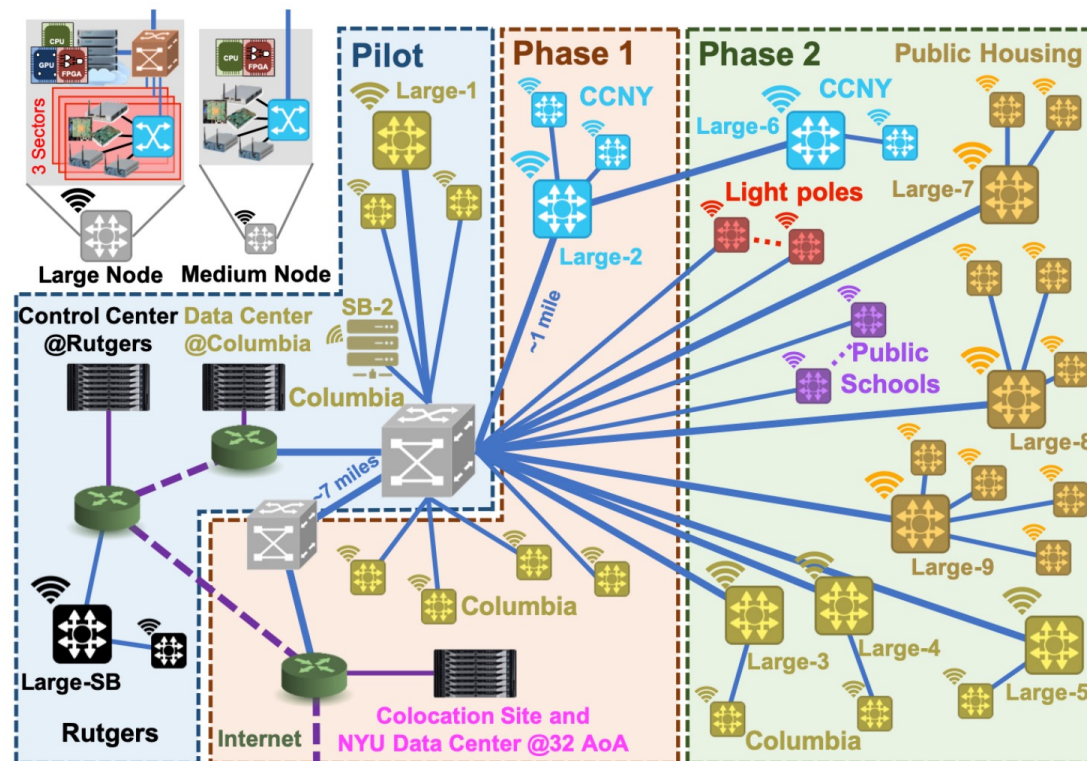

Network simulation good for:

- Fast and ubiquitous experiment setup and testing
- Testing and debugging of conceptual ideas
- Scalability to thousands of nodes
- Accessible to all

a) Experimentation through open testbed

Open testbeds can be accessed by industry and academy researchers who cannot build their own testbed infrastructure:

US-based COSMOS

More at: <https://wiki.cosmos-lab.org/wiki>

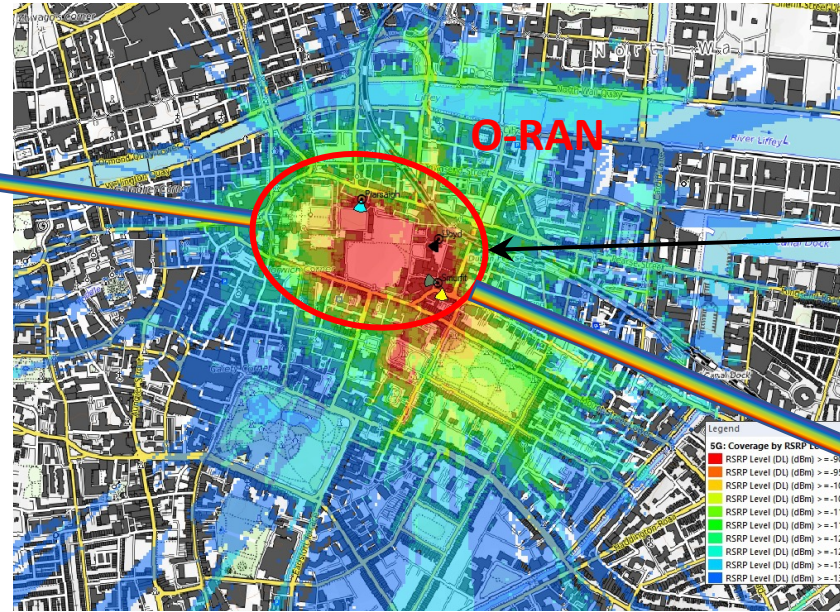

a) Experimentation through open testbed: OpenIreland

www.openireland.eu

Based in Trinity College campus

Radio and Optical
Communications Laboratory

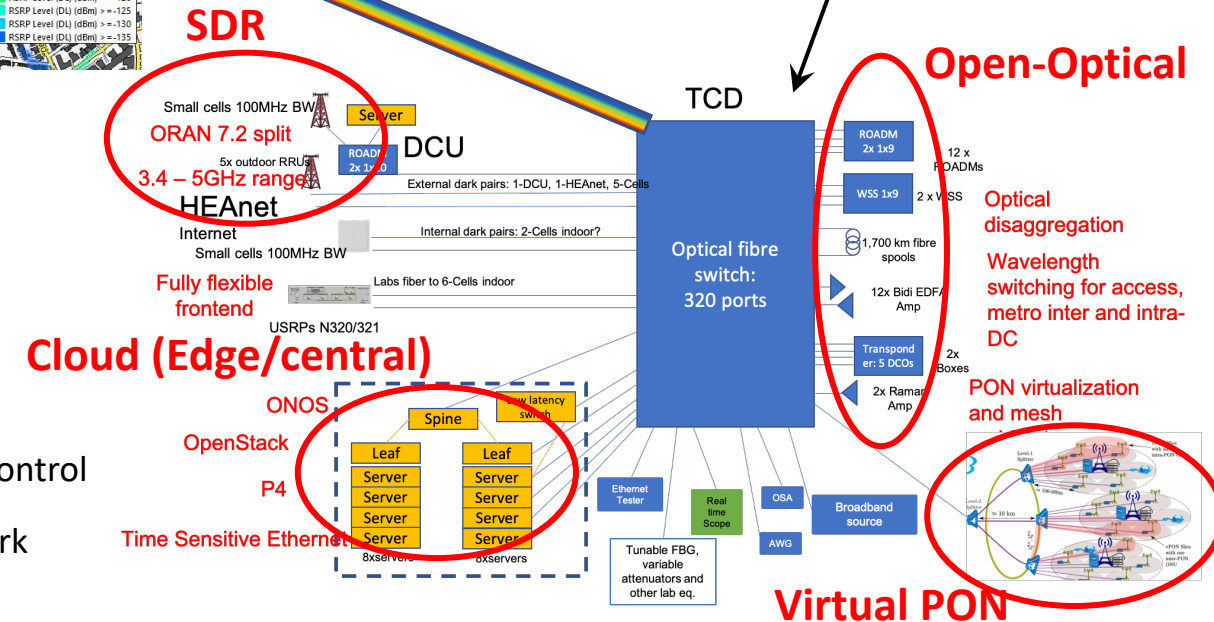

CONNECT research centre building

Reconfigurable and Lego-like topology reconfiguration with following blocks:

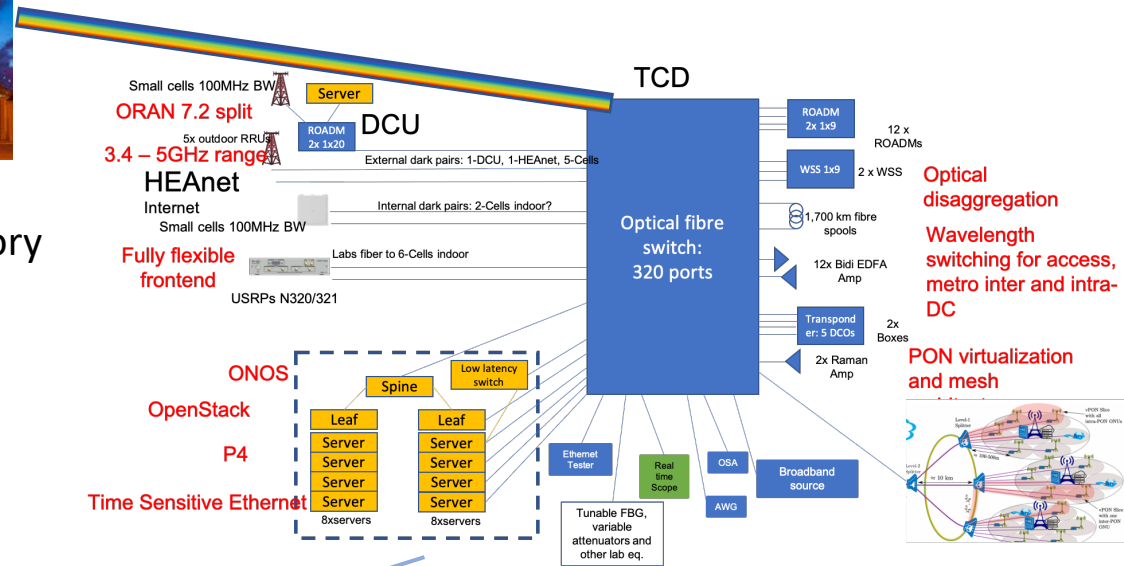

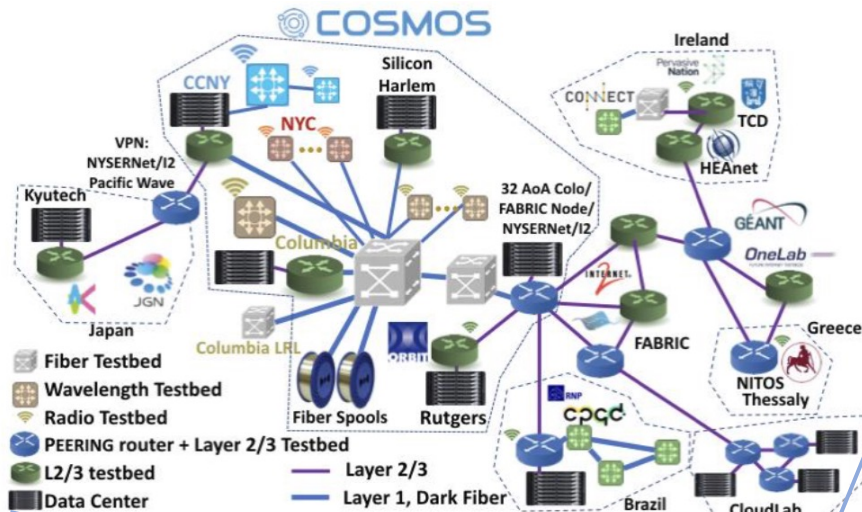

- 2,000km fibre, power splitters, etc.
- SDN ROADMs (Lumenutm), in line amplifiers and coherent Tx (Cassini)
- Virtual PON prototype (including EAST-WEST ODN – reflective filters)
- 5G O-RAN (outdoor and indoor); USRP SDR running 5G OAI (and soon SRS)
- Server virtualisation
- Laboratory measurements: OSA, power meters, etc.

Run an experiment:

- Use optical fibre switch to put together a suitable physical topology of such blocks
- Load your image into servers for data plane (5G-SDR, Virtual PON, etc..) and SDN control plane
- Load your SDN control plane and run experiment (execute commands, read network parameters, train ML algorithm, etc.)

a) Experimentation through open testbed: global interconnectivity

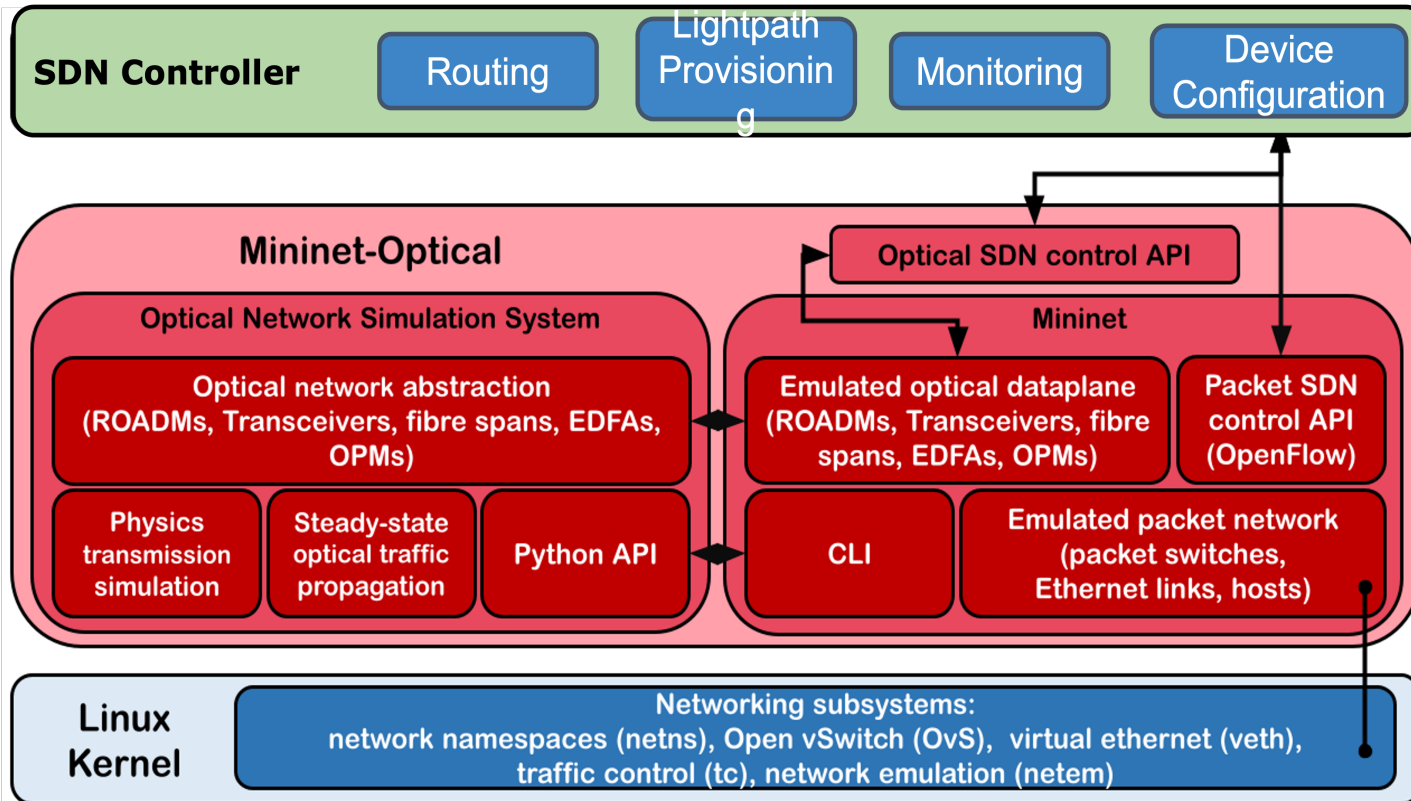

COSMIC:
Manhattan –
New Jersey

OpenIreland

RARE P4
testbed

RARE @UFES

b) Experimentation through open software: Mininet-Optical

Node types:

- Transponders: modulation, baud rate, power, wavelength, BER from gOSNR
- ROADMs: insertion loss, variable attenuation, wavelength routing, booster/preamp
- EDFA: linear gain, wavelength dependent gain, ASE, automatic gain control mode
- Fibre length: attenuation, dispersion, SRS, nonlinear impairments through the GN model
- Performance monitors to emulate different types: power, OSNR, gOSNR,...

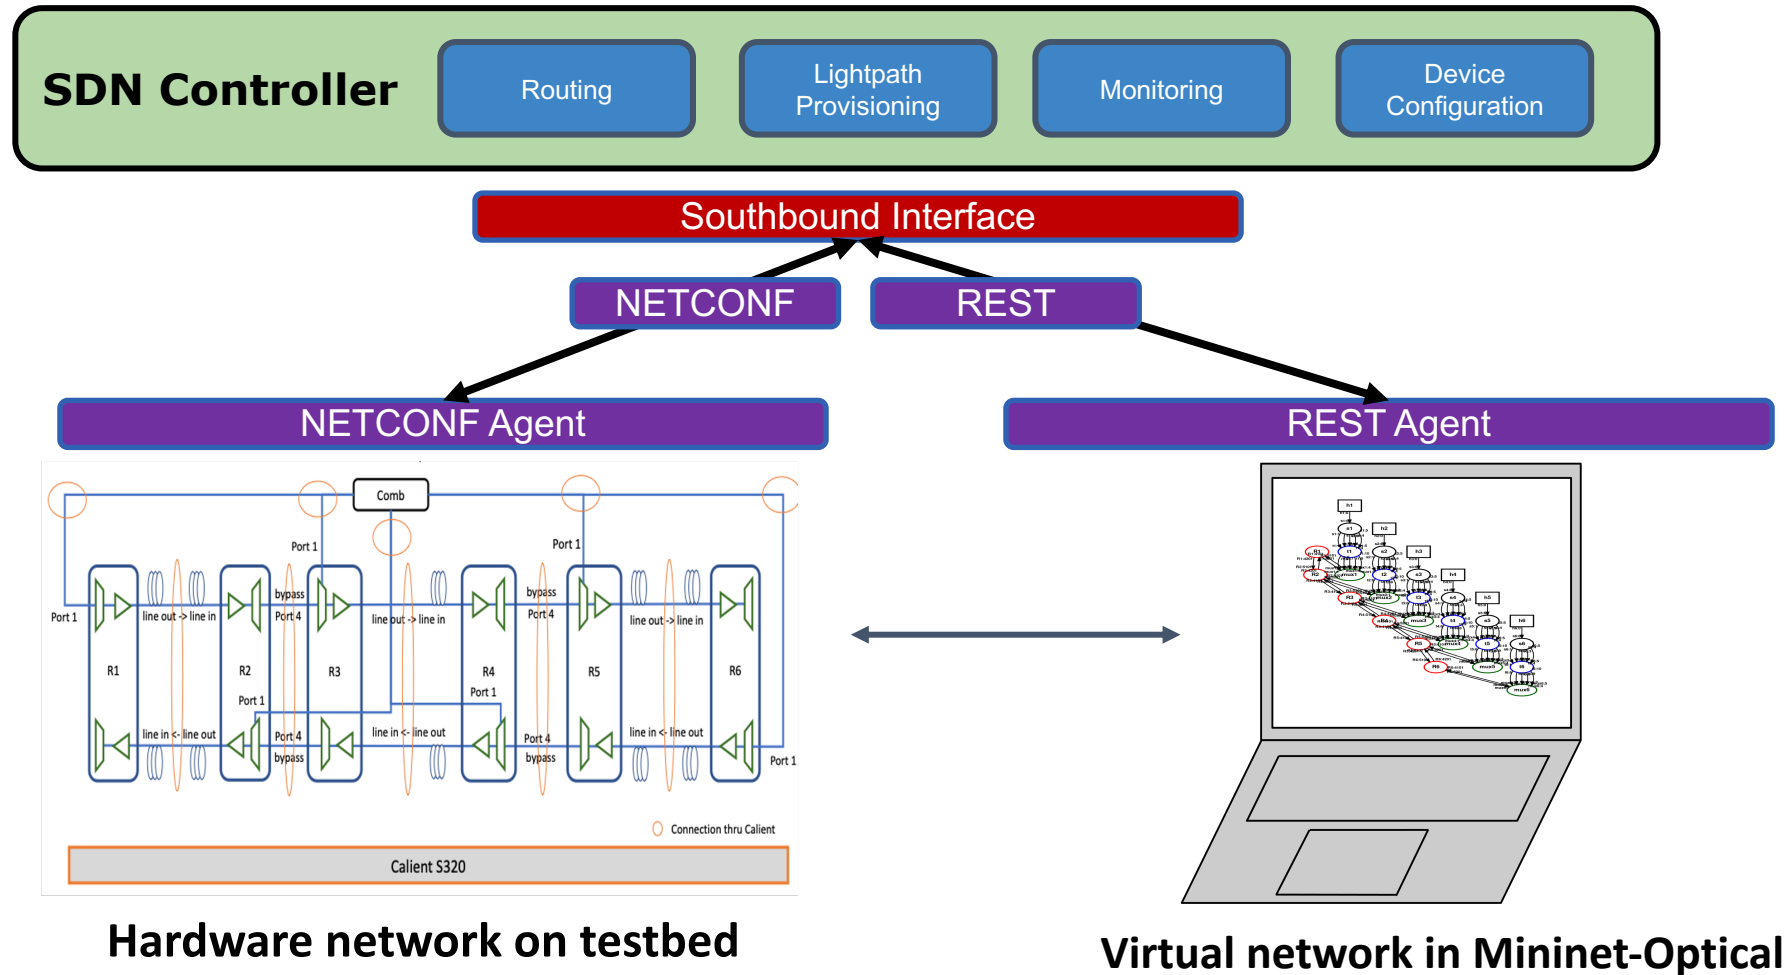

```
def build( self, txCount=4 ):
    "Build our network topo"
    h1, h2 = self.addHost('h1'), self.addHost('h2')
    transceivers = [ ('t%d' %t, 0*dBm, 'C')
                     for t in range(1, txCount+1) ]
    t1, t2 = [ self.addSwitch( name, cls=Terminal,
                               transceivers=transceivers )
              for name in ('t1', 't2') ]
    self.ethLink( h1, t1 )
    self.ethLink( h2, t2 )
    boost = ( 'boost', dict(target_gain=1.0) )
    spans = [ 50.0, ( 'amp1', dict(target_gain=50*.22) ),
              50.0, ( 'amp2', dict(target_gain=50*.22) ) ]
    self.wdmLink( t1, t2, boost=boost, spans=spans)

Control plane development through synergetic simulation and testbed experimentation

Use case 1: Metro Front-haul Provisioning

Diurnal traffic variation of Residential vs. Office traffic

This changes the traffic pattern over the transport network

The controller allocates RUs to BBU locations, depending on demand and available network and computing resources

The controller also monitors OSNR. If this goes below given thresholds, it reduces modulation from 16-QAM (200 Gb/s) to QPSK (100 Gb/s) or BPSK (50 Gb/s). Rerouting and re-provisioning is also possible.

Use case 1: Metro Front-haul Provisioning – Mininet-Optical

Four ROADMs:

(r1,r4): 1-degree

(r2,r3): 2-degree

Links are fiber pairs (i.e. both directions)

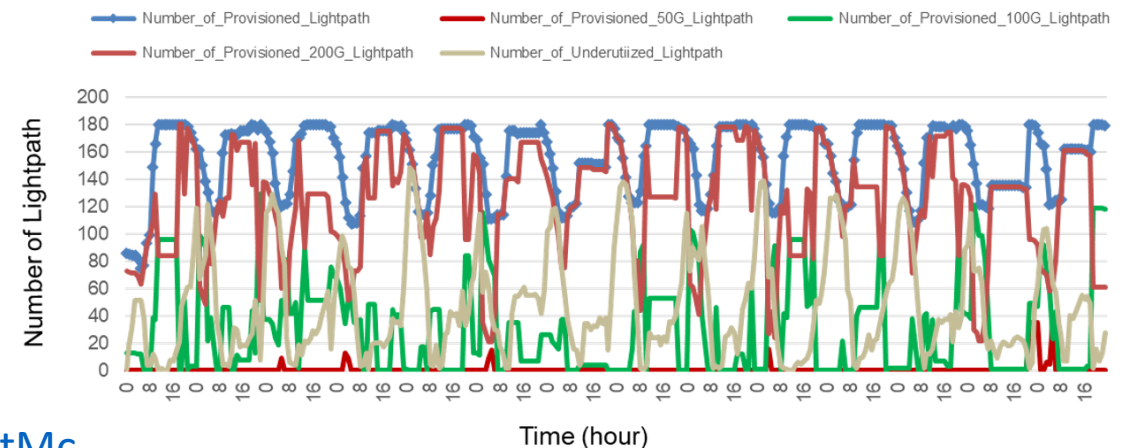

Endpoints: Data Centers (h1, h4); RU aggregation (h2, h3)

90 transceivers/channels per endpoint

End-to-end model with Optical (ROADM rN, Terminal tN) as well as packet (Host hN, Router sN) elements

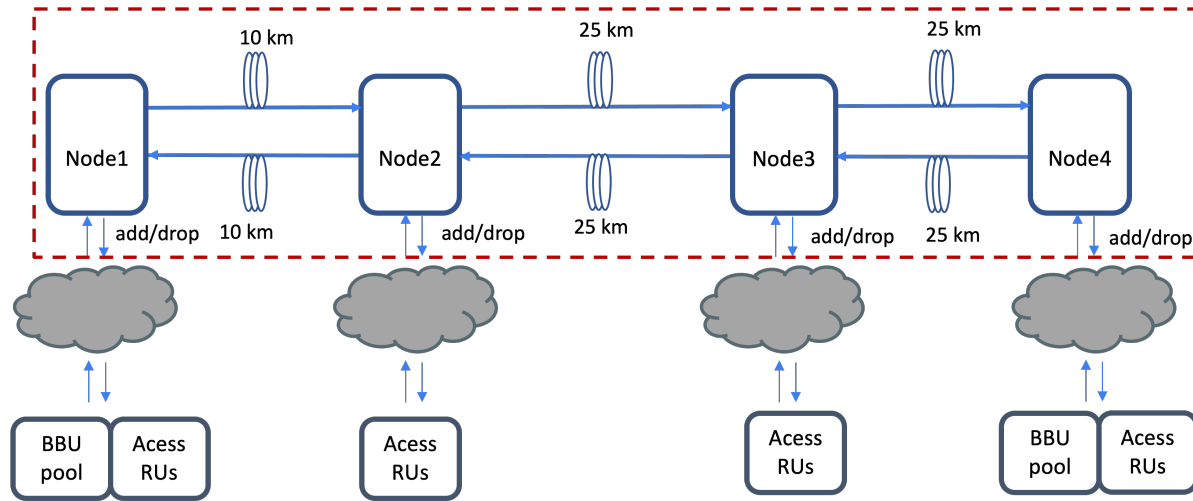

- The emulation shows an example of how the lightpaths are reprovisioned over time.

Provisioned Lightpath

Watch the video at: <https://www.youtube.com/watch?v=Bi2E-sGytMc>

Use case 1: Metro Front-haul Provisioning – COSMOS

Run same controller used for Mininet-Optical for setting up and tearing down of lightpaths:

- Configuration across multiple ROADMs
- Configuration of transceiver
- Measurement of power levels

Control plane

```

Use case 2: Building a QoT estimation algorithm

Control plane algorithm development and test based on simulation:

- Online learning through agent that loads the optical spectrum with optical channel and measures OSRN variation
- Through multiple iterations the agent improves strategy for channel selection

Control plane algorithm test on testbed:

- Agent automatically loading the network topology through a comb generator
- Control plane becomes aware of all devices, their interfaces, their behavior, their response time... and how to read and interpret the results
- ... to be continued...

Conclusions

- Optical layer disaggregation extend the open systems concept to the optical layer.
- Machine learning can provide advantages in automatic most decision.
- However, it is critical to develop and test such ideas considering control plane and real hardware limitation.
- Shown examples of open testbeds that can enable testing remotely.
- Shown the (soon to be released as open source) Mininet-Optical, for fast deployment.
- Synergy between simulation and testbed experimentation to use same controller across two platforms.
- Still much work to be done..
